### Настройка PAM

Через подключаемые модули аутентификации (PAM) указывается как нужно проводить аутентификацию, авторизацию и смену пароля в системе, а также можно назначать запуск дополнительных действий при старте пользовательского сеанса.

Некоторые пакеты модулей PAM предоставляют профили, которые можно использовать для автоматического регулирования поведения всех использующих PAM программ в системе. Выберите профили, которые нужно применить.

Активируемые профили PAM:

```
[*] Pwquality password strength checking
[ ] Cracklib password strength checking
[*] mkhomedir
[*] Kerberos authentication
[*] Kiosk2 user confinement
[*] pam tally
[*] Unix authentication
[*] Winbind NT/Active Directory authentication
[ ] SSS authentication
[*] Register user sessions in the systemd control group hierarchy
```
